2:
3: //
4: // The class std::stack does not provide an iterator, which is
5: // needed for this class. So, like std::stack, class iterstack
6: // is implemented on top of a container.
7: //
8: // We use private inheritance because we want to restrict
9: // operations only to those few that are approved. All functions
10: // are merely inherited from the container, with only ones needed
11: // being exported as public.
12: //
13: // No implementation file is needed because all functions are
14: // inherited, and the convenience functions that are added are
15: // trivial, and so can be inline.
16: //
17: // Any underlying container which supports the necessary operations
18: // could be used, such as vector, list, or deque.
19: //
